Seasonal Sales

Sales Patterns

Project Overview

This project focuses on analyzing retail sales data to identify key factors influencing outlet performance, product demand, and revenue generation. The primary objective of the study is to derive actionable insights that can help improve sales efficiency, optimize inventory management, and enhance overall business performance.

The dataset consists of various attributes such as item type, outlet type, outlet size, location tier, item visibility, and pricing (MRP). Advanced data analysis techniques were applied using tools like Looker Studio and Google sheet to clean, process, and visualize the data effectively. Multiple dashboards were created to evaluate sales performance across different dimensions, including category-wise revenue, outlet performance by location, and pricing impact on sales.

The analysis reveals that the total outlet sales reached approximately 18.6 million, with categories like Fruits and Vegetables, Snack Foods, and Household items contributing the highest share of revenue. It was observed that Tier 3 locations and supermarket-type outlets generated comparatively higher sales, indicating stronger demand in these regions. Additionally, pricing plays a significant role in influencing sales, with certain price ranges showing higher customer preference.

Further insights highlight that product visibility and outlet establishment year also impact sales performance. Some outlets and items consistently outperform others, suggesting opportunities for targeted marketing and inventory optimization.

In conclusion, the project demonstrates that data-driven decision-making can significantly enhance retail performance. By focusing on high-performing categories, optimizing pricing strategies, and improving outlet-level operations, businesses can increase profitability and achieve sustainable growth.
